

## Swing Carriage

Swing Carriages - The load capacity of a forklift jib has a most of about 1935 pounds to 6000 pounds on either the extended or retracted positions range. You might have to check with a material handling specialist concerning the particular limits of your forklift use. The load capacity rankings are really used for the jib itself and not the forklift or even the utmost load which can be handled securely with a particular forklift. It is important to bear in mind that every time any accessories like a forklift jib are added to the lift truck, the new center of gravity made by the accessory will lessen the overall lift capability of the forklift. There are instructions available which provide details on how to accurately gauge these load limits.

Before the use of whatever lift truck jib, make sure that the hooks and shackles are properly secured to the lift truck. Make sure and even double check that the pins are tight. It is necessary that the weight calculations have been properly made and double checked. Keep in mind to consider the truth that rated capacities sometimes lessen when the boom is in an elevated position, whenever the boom is extended with telehandlers or even each time the mast is tilted frontward.

Some vital tips regarding the modifiable jib are: don't ever pull a load utilizing a lift truck jib accessory, in view of the fact that these accessories are really used for vertical lift only. All the time lift the load without letting it move backward and forward. Utilize extreme caution each time a load is carried so as to prevent tipping over the truck.
