

## Steering Valve for Forklifts

Steering Valves for Forklift - A valve is a device that controls the flow of a fluid like for example slurries, fluidized gases or regular gases, liquids, by opening, closing or partially obstructing some passageways. Valves are usually pipe fittings but are commonly discussed as a separate category. In cases where an open valve is concerned, fluid flows in a direction from higher to lower pressure.

Valves are used in numerous applications like for instance residential, transport, commercial, military and industrial trades. Some of the major trades that depend on valves consist of the chemical manufacturing, power generation, water reticulation, sewerage, oil and gas sector and mining.

Most valves being used in everyday activities are plumbing valves, which are utilized in taps for tap water. Other common valves comprise kinds fitted to dishwashers and washing machines, gas control valves on cookers, valves in car engines and safety devices fitted to hot water systems. In nature, veins within the human body act as valves and regulate the blood flow. Heart valves even control the circulation of blood in the chambers of the heart and maintain the proper pumping action.

Valves could be worked in various ways. Like for instance, they could be operated either by a pedal, a lever or a handle. Valves can be driven by changes in temperature, pressure or flow or they could be automatic. These changes could act upon a piston or a diaphragm which in turn activates the valve. Various popular examples of this kind of valve are seen on safety valves or boilers fitted to hot water systems.

Valves are used in many complicated control systems which can require an automatic control that is based on external input. Controlling the flow through the pipe to a changing set point is an example. These circumstances normally require an actuator. An actuator would stroke the valve depending on its set-up and input, that enables the valve to be positioned precisely while enabling control over various needs.
